

Comparison of **Swallowing** Characteristics in Patients with Dysphagia and Normal Controls

2013. 6. 23

¹Department of Industrial Management Engineering, POSTECH

²Department of Neurology, Samsung Medical Center

AGENDA

▪ Introduction

- ✓ Background
- ✓ Objective of the Study

▪ Approach

▪ Results

- ✓ Swallowing Characteristics: Controls vs. Patients
- ✓ Diagnostic Model for Dysphagia

▪ Discussion

Dysphagia: Clinical Significance

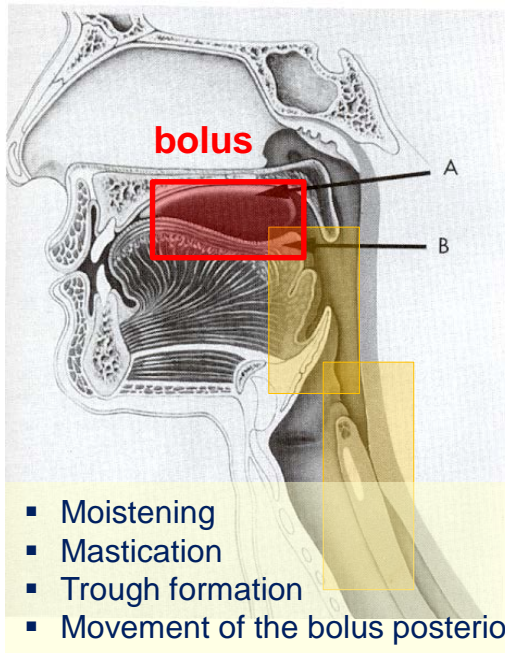

- ❑ **Definition:** difficulty in swallowing food
- ❑ **Etiology:** mainly accompanied by neurologic diseases (e.g., stroke) (Daniels et al., 2006)
- ❑ **Symptom:** aspiration, pneumonia, dehydration, malnutrition
- ❑ **Prevalence:** increased with age, particularly high among older adults (> 60 yrs.) (Morris, 2006; Robbins and Barczy, 2003)

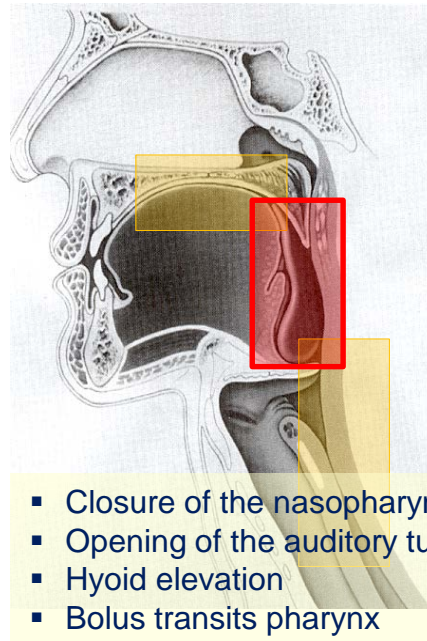

⇒ Because dysphagia improperly diagnosed and/or treated may lead to **asphyxiation and death**, **early and accurate identification and proper therapy** are important

Swallowing Process

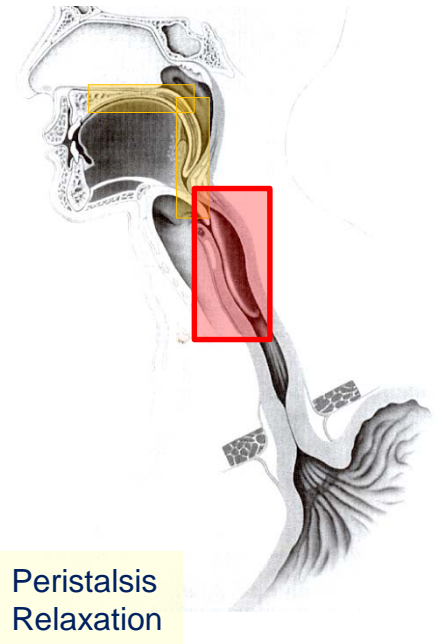

Oral preparatory phase & Oral phase

Pharyngeal phase

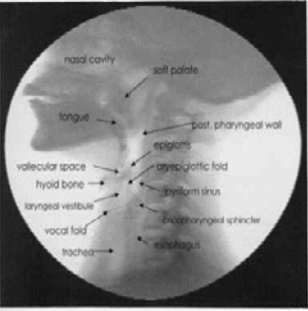

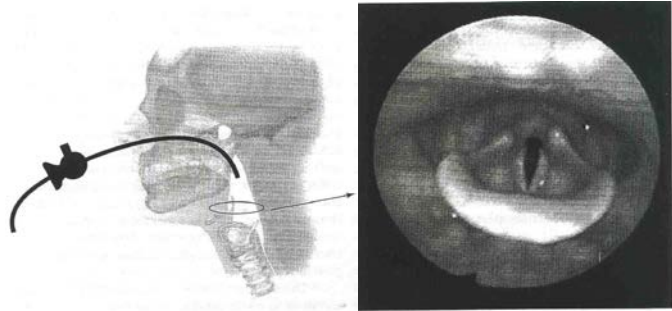

Esophageal phase

⇒ Oral phase: easy to observe

⇒ Pharyngeal phase: **difficult to observe** → need a **specialized device** to examine swallowing of food inside the pharynx

Diagnosis Methods for Dysphagia

| | VideoFluoroscopic Swallowing Study (VFSS) | Fiberoptic Endoscopic Evaluation of Swallowing (FEES) |
|--------------|---|---|
| Illustration |   |  |
| Method | Record fluoroscopy images by X-ray and evaluate dysfunctions of swallowing | Insert a flexible endoscope through the nose |
| Limitation | <ul style="list-style-type: none"> ▪ Radiation exposure | <ul style="list-style-type: none"> ▪ Invasiveness |
| | <ul style="list-style-type: none"> ▪ General-purpose device with high price ▪ Qualitative assessment ▪ Not usable in daily activities ▪ Lack of therapeutic functions for dysphagia | |

⇒ Need to develop a **device specialized** to dysphagia with **high safety and usability**

Recent Studies for Measurement of Swallowing

Swallowing sound measurement by sonar Doppler

| | Santos and Macedo-Filho (2006) | Cagliari et al. (2009) |
|--------------------------|--|--|
| Title | Sonar Doppler as an Instrument of Deglutition Evaluation | Doppler Sonar Analysis of Swallowing Sounds in Normal Pediatric Individuals |
| Participants | Brazilian 50 persons (25 females, 25 males; mean age: 32 years, 18 ~ 50 years) | Brazilian 90 persons (45 females, 45 males; 3 groups: 2~5, 5~10, 10~15 years) |
| Apparatus | <ul style="list-style-type: none"> H/W: Sonar Doppler S/W: VOX METRIA | <ul style="list-style-type: none"> H/W: Sonar Doppler S/W: VOX METRIA |
| Swallowing food (volume) | <ul style="list-style-type: none"> Saliva Liquid (10 ml of water) Pasty (10 ml) | <ul style="list-style-type: none"> Saliva Liquid (N.S.) Pasty (N.S.) |
| Measures | <ul style="list-style-type: none"> Peak intensity Peak frequency Swallowing duration time | <ul style="list-style-type: none"> Peak intensity Peak frequency Swallowing duration time |
| Analysis | <ul style="list-style-type: none"> Mean \pm 95% C.I. | <ul style="list-style-type: none"> Mean \pm 95% C.I. Gender, age, swallowing food effects (ANOVA) |

⇒ **Limitation:** Sounds measured include those not related to swallowing (e.g., respiration, voice production)

Research Objective

Comparison of **Swallowing** Characteristics in Patients with Dysphagia and Normal Controls Using a **Ultrasonic Doppler Sensor**

1. **Development** of a **swallowing** measurement and analysis system
2. **Quantification** of the **swallowing** function in the pharyngeal phase
3. **Comparison** of **dysphagic** patients with normal controls
4. **Establishment** of a **diagnostic** model for dysphagia

Research Protocol

S1. System development

- Ultrasonic Doppler sensor
- Swallowing measurement S/W

S2. Quantification

- Swallowing measures
- Quantification S/W

S3. Experiment

- Dysphagic patients vs. normal controls
- Various swallowing types and volumes

S4. Analysis

- Pairwise comparison
- Diagnostic model

S1. Development: **Swallowing Measurement Device**

1 / 3

- ❑ **Measurement: movement of organs related to the pharynx**

Sensor specification
(Model: DEPST-D2M5C)

| | |
|------------------------------|--------------------------------|
| Frequency | 2 MHz |
| Element count | 5 |
| Element length | 5 mm |
| Kurf | 1 mm |
| Pitch | 6 mm |
| Element width | 6 mm |
| Wire | Micro coaxial cable (100pF) |
| Transducer surface radius | 158R |

S1. Development: Case & Band

- ❑ Case for housing the sensor; flexible band for locating the sensor to the neck securely.

Curved surface
for adhering to the neck

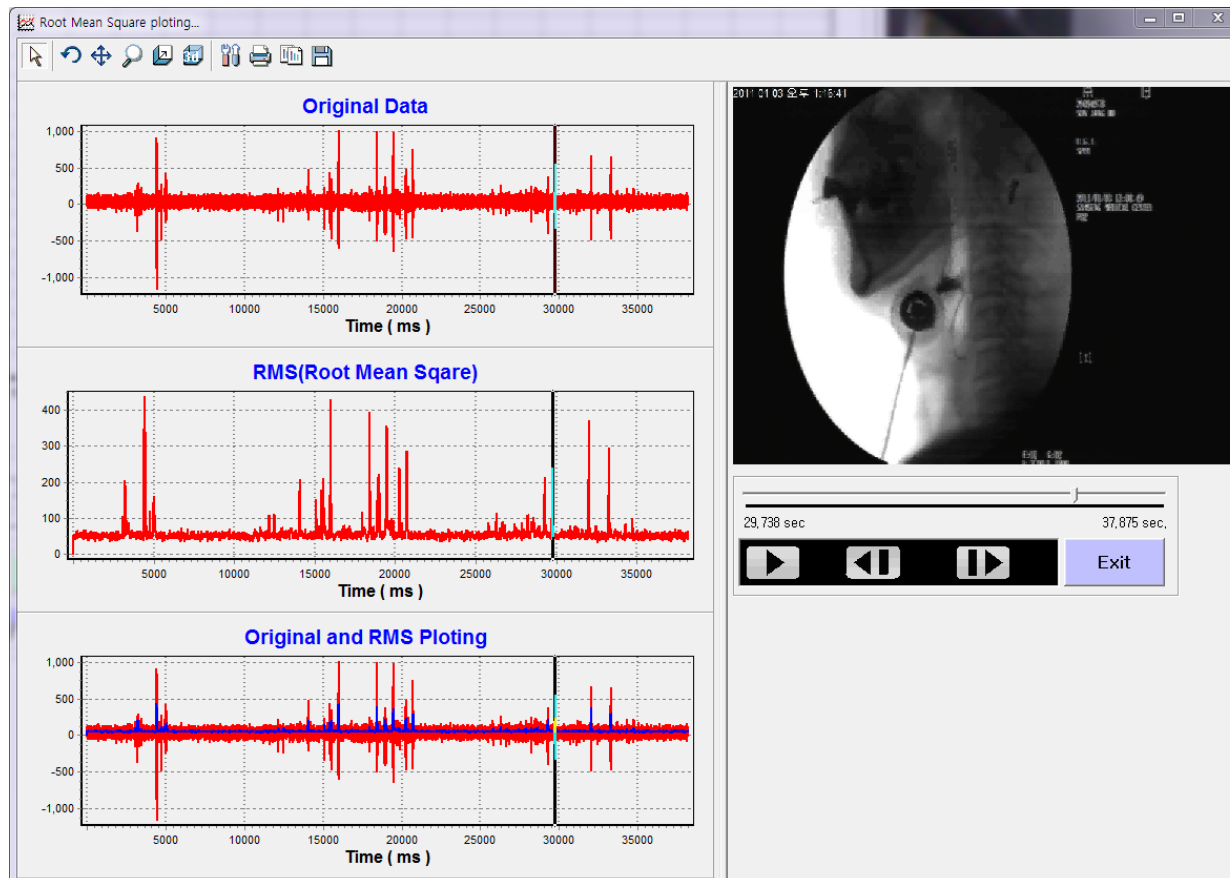

Ultrasonic Doppler
Sensor

S1. Development: Analysis S/W

3 / 3

- ❑ Real-time plotting of swallowing signal measurements
- ❑ Interoperating with VFSS images

S2. Quantification: Signal Processing

S1. Signal **rectification**: (-) values \rightarrow (+) values

S2. **Smoothing** by the moving average method

- Lag $n = 50$

S3. **Starting and ending points** detection

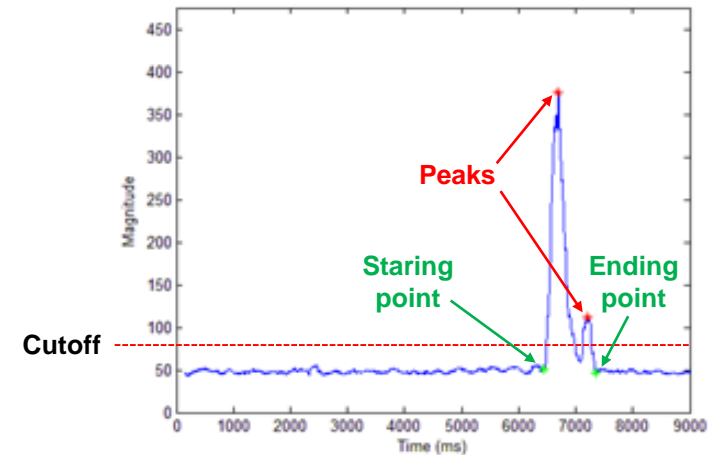

- Detecting slope = 0.9

S4. **Peak** detection

- Cutoff = 50

Rectified signal

Smoothed signal

S2. Quantification: Measures

Peak amplitude

No. of peaks

Peak-to-peak interval

Duration

Impulse

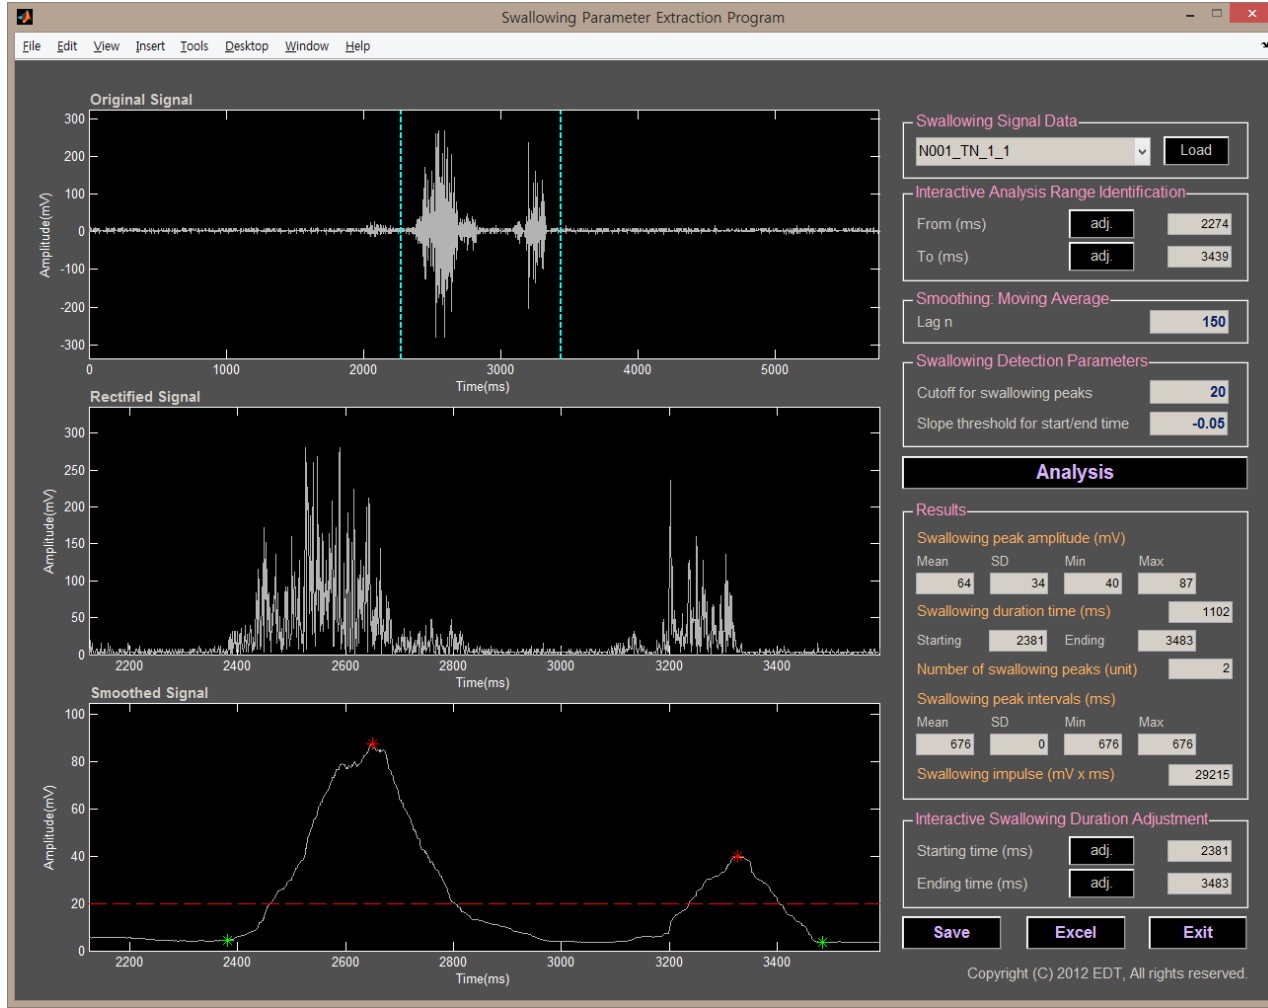

S2. Quantification: Analysis S/W

Automatic extraction of five swallowing quantification measures

Original signal

Rectified signal

Smoothed signal

Input:
Parameters
- Lag n
- Slope
- Cut off

Output:
swallowing
quantification
measures

Interactive
adjustment
function

S3. Experiment: Method

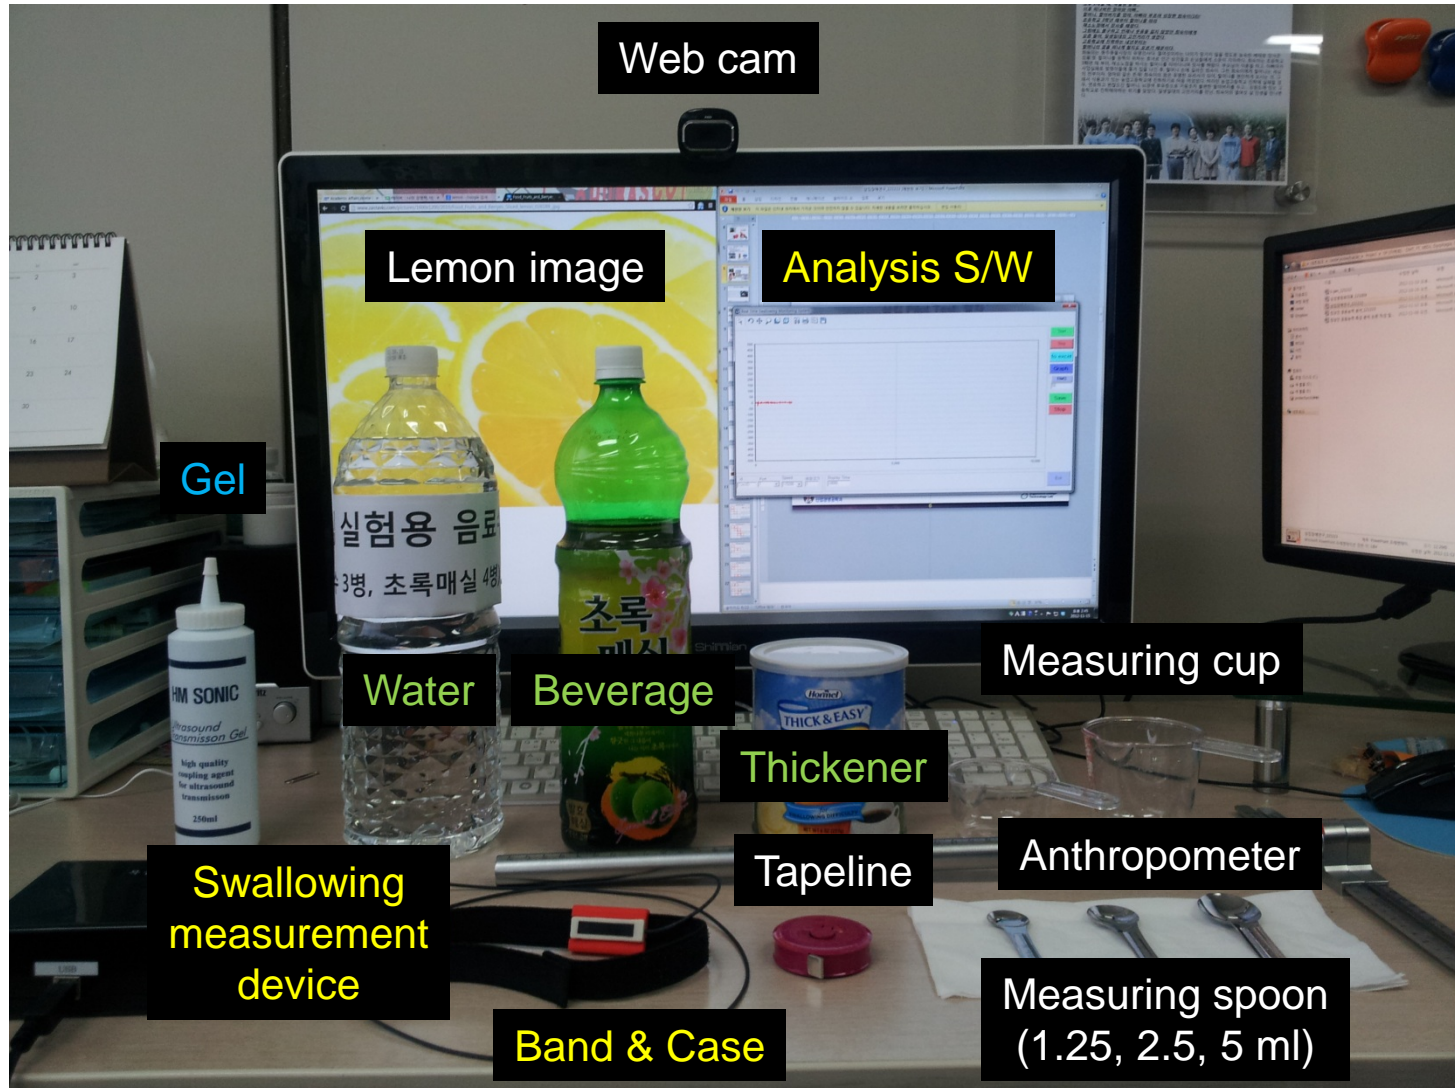

- ❑ Participants: 120 normal controls (NC), 36 dysphagic patients (DP)
- ❑ Swallowing types and volumes (# repetitions = 3)
 - ✓ Dry saliva (DS)
 - ✓ Thin liquid (TN; water): 1, 3, 9 ml
 - ✓ Thick liquid (TK; beverage with thickener): 1, 3, 9 ml

| NC | 20s | 30s | 40s | 50s | 60s | 70s | 80s | Total |
|--------|-----|-----|-----|-----|-----|-----|-----|-------|
| Female | 10 | 10 | 10 | 10 | 10 | 10 | - | 60 |
| Male | 10 | 10 | 10 | 10 | 10 | 10 | - | 60 |
| Total | 20 | 20 | 20 | 20 | 20 | 20 | - | 120 |

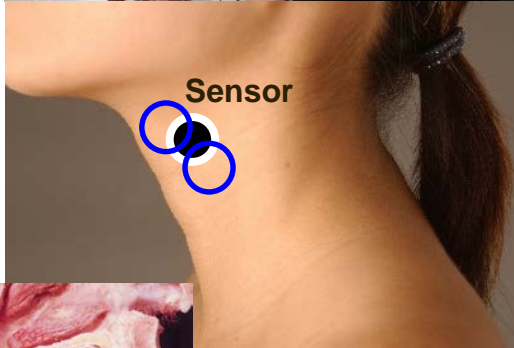

| DP | 20s | 30s | 40s | 50s | 60s | 70s | 80s | Total |
|--------|-----|-----|-----|-----|-----|-----|-----|-------|
| Female | - | 1 | - | 1 | 1 | 4 | 3 | 10 |
| Male | - | - | 1 | 6 | 12 | 5 | 2 | 26 |
| Total | - | 1 | 1 | 7 | 13 | 9 | 5 | 36 |

- ⇒ Age distribution of DPs over age 50 = 94%
- ⇒ Gender ratio of DPs → female: male = 2: 5
- ⇒ Swallowing volumes of DPs in the study: up to 3 ml (difficult to swallow 9 ml)

S3. Experiment: Apparatus

S3. Experiment: Protocol

Finding a location on the neck for good **signal acquisition**

Experiment time: 20 min

S1. Informed consent

(3 min)

S2. Practice

(5 min)

S3. Main experiment

(7 min)

S4. Debriefing

(5 min)

- ※ Swallowing order: **randomized**
- ※ Rest time bwn. swallowing: **5 sec**

< Example >

Session 1: **thin liquid** 3, 1, 9 ml

↓ 30 sec

Session 2: **saliva**

↓ 30 sec

Session 3: **thick liquid** 9, 3, 1 ml

S3. Experiment: **Demonstration**

S4. Result: Swallowing Peak Types

Normal controls

Short-double peak signal (43%)

Short-single peak signal (39%)

Short-multiple peak signal (18%)

Dysphagic patients

Short-double peak signal (58%)

Long-double peak signal (33%)

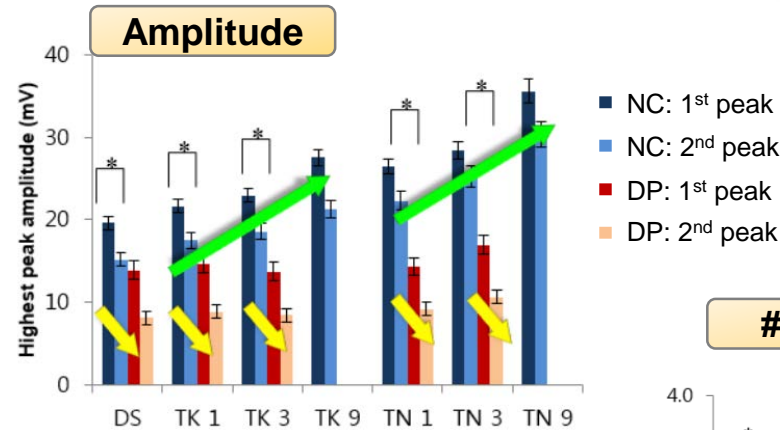

Long-multiple peak signal (9%)

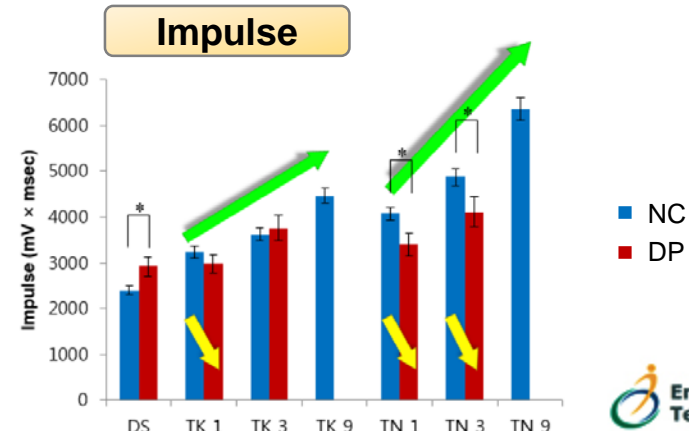

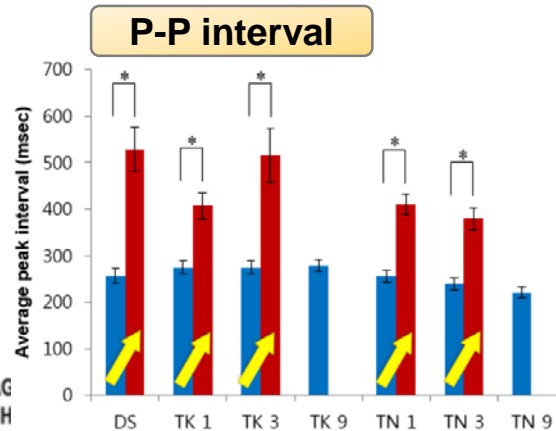

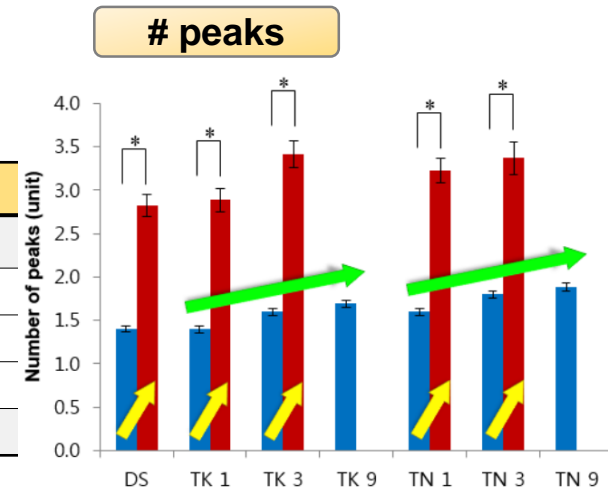

S4. Result: NC vs. DP

* $p < 0.05$

| Measure | NC | | DP |
|--------------|----|---|---------|
| Amplitude | 1 | > | 0.63 ↓ |
| Duration | 1 | < | 2 ~ 4 ↑ |
| # peaks | 1 | < | 2 ↑ |
| P-P interval | 1 | < | 2 ↑ |
| Impulse | 1 | > | 0.67 ↓ |

S4. Diagnostic Model: Method

Covariates

Amplitude (mV)

- Highest peak
- 2nd highest peak
- Highest - 2nd highest peak
- Average peak

Duration (msec)

peaks (unit)

Interval (msec)

- Longest peak interval
- 2nd longest peak interval
- Highest - 2nd highest interval
- Average peak interval

Impulse (mV x msec)

Factors

Age (year)

Gender (female, male)

Cumulative
logit
model
(ordinal
logistic
regression)

Degree of dysphagia

- 0: normal
- 1: mild
- 2: moderate / severe

| | 20s | 30s | 40s | 50s | 60s | 70s | 80s | Total |
|-------------------|-----|-----|-----|-----|-----|-----|-----|-------|
| Mild | - | 1 | - | 5 | 8 | 4 | 1 | 19 |
| Moderate & Severe | - | - | 1 | 2 | 5 | 5 | 4 | 17 |
| Total | - | 1 | 1 | 7 | 13 | 9 | 5 | 36 |

⇒ Used data: **TN 1 ml** for practicality

⇒ Eliminated data of **5%** by $\pm 2SD$ and $CV < 0.5$

S4. Diagnostic Model: Performance

| | | Actual class | | |
|-----------------|-------------------|--------------|------|-------------------|
| | | Normal | Mild | Moderate & Severe |
| ※ $n = 151$ | | | | |
| Predicted class | Normal | 120 | 0 | 1 |
| | Mild | 0 | 13 | 0 |
| | Moderate & Severe | 0 | 4 | 13 |

- Specificity = 100%
- Sensitivity for mild = 76%
- Sensitivity for moderate/severe = 93%

Discussion

- Quantitative swallowing assessment of the movement of the phalangeal organs using an ultrasonic Doppler sensor

| Measure | NC | | DP |
|--------------|----|---|---------|
| Amplitude | 1 | > | 0.63 ↓ |
| Duration | 1 | < | 2 ~ 4 ↑ |
| # peaks | 1 | < | 2 ↑ |
| P-P Interval | 1 | < | 2 ↑ |
| Impulse | 1 | > | 0.67 ↓ |

⇒ Dysphagic patients: more swallowing due to impaired movement in the pharynx by stenosis or dysfunction → amplitude ↓, duration ↑

- Diagnostic model development for the severity of dysphagia: normal, mild, moderate/severe (specificity = 100%, sensitivity for mild = 76%, sensitivity for M/S = 93%)

⇒ Clinically effective system for dysphagia diagnosis using measurements from swallowing only 1 ml of water

Future Study

- ❑ Interoperation with **dysphagia therapy technology**

At lunch time

Difficult
in swallowing

Swallowing
assisted
in real-time

⇒ Assist swallowing in **real-time** by interoperating with a **functional electrical stimulation (FES)** system (automatic stimulation of neck muscle at the right time)

Q & A

Thank You for your attention!
